Cybersecurity and Digital Forensics

Kathmandu, Nepal

April 10, 2025

Task 1 : Programming Exercises:[Data types and Conditional Statements]

1. Write a program that takes a temperature value from the user. It should then allow the user to choose between Celsius (C) and Fahrenheit (F) for conversion. After the user selection, it should then convert the entered temperature to the chosen scale and display the result.

Use appropriate data types for temperature and handle error like non-numeric input.

Use the following formula for conversion:

$$F = (C \times 9/5) + 32$$

$$C = (F - 32) \times 5/9$$

```
#include <iostream>
#include <limits>

using namespace std;

class TemperatureConverter
{
private:
    double temperature;
public:
    void getdata()
    {
        cout << "-----" << endl;
        cout << "Enter temperature value: ";

        while (!(cin >> temperature))
        {
            cout << "Invalid input. Please enter a numeric temperature value: ";
            cin.clear();

            cin.ignore(numeric_limits<streamsize>::max(), '\n');
```

```

    }

    cout << "-----" << endl;
}

double converttoFahrenheit()
{
    return (temperature * 9.0 / 5.0) + 32;
}

double converttoCelsius()
{
    return (temperature - 32) * 5.0 / 9.0;
}

void convertTemperature()
{
    char choice;

    cout << "-----" << endl;

    cout << "Convert to (C)elsius or (F)ahrenheit? Enter C or F: ";
    cin >> choice;

    if (choice == 'f')
    {
        cout << "Converted Temperature: " << converttoFahrenheit() << "
F" << endl;
    }

    else if (choice == 'c' || choice == 'C')
    {

```

```

        cout << "Converted Temperature: " << converttoCelsius() << " C"
<< endl;

    }
    else
    {

        cout << "Invalid choice. Please enter 'C' or 'F'." << endl;

    }

    cout << "-----" << endl;

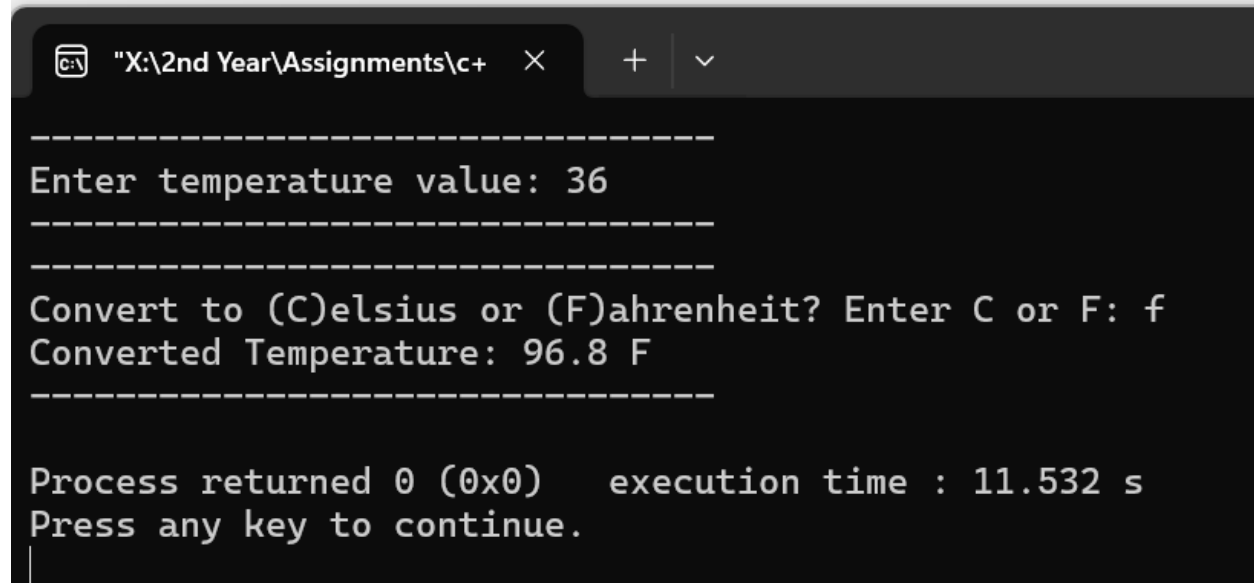

}
};

int main()
{
    TemperatureConverter C1;

    C1.getdata();
    C1.convertTemperature();

    return 0;
}

```

```

-----
Enter temperature value: 36
-----
Convert to (C)elsius or (F)ahrenheit? Enter C or F: f
Converted Temperature: 96.8 F
-----

Process returned 0 (0x0)   execution time : 11.532 s
Press any key to continue.

```

```
"X:\2nd Year\Assignments\c+  X + v
-----
Enter temperature value: 100
-----
-----
Convert to (C)elsius or (F)ahrenheit? Enter C or F: c
Converted Temperature: 37.7778 C
-----

Process returned 0 (0x0)    execution time : 10.716 s
Press any key to continue.
|
```

Task 1 : Programming Exercises:[Data types and Conditional Statements]

2. Write a C++ program to implement a number guessing game with different difficulty levels.
Easy difficulty ranges from 1-8, medium from 1-30, hard from 1-50. Then, generate a random number to check if the guess is correct based on the user's selection.
[10 marks]

```
#include <iostream>
#include <cstdlib>
#include <ctime>

using namespace std;

class guessingGame {
private:
    int maxRange;
```

```

    int randomNumber;

public:
    void difficultylevel()

    {

        int choice;

        cout << "-----" << endl;
        cout << "Select difficulty level:" << endl;
        cout << "-----" << endl;

        cout << "1. Easy Level (1-8)" << endl;
        cout << "2. Medium Level (1-30)" << endl;
        cout << "3. Hard Level (1-50)" << endl << endl;

        cout << "-----" << endl;
        cout << "Enter which level you want to play (1-3): "<<endl;
        cout << "-----" << endl;

        cin >> choice;
        cout << "-----" << endl;

        switch (choice)
        {
            case 1:

                maxRange = 8;
                break;

            case 2:

                maxRange = 30;
                break;

            case 3:

                maxRange = 50;
                break;

            default:

                cout << "Invalid choice! Defaulting to Easy Level.\n";
                maxRange = 8;

```

```

    }
}

void generateRandomNumber()

{
    srand(time(0));
    randomNumber = (rand() % maxRange) + 1;
}

void playGame()

{
    int guess;

    cout << "-----" << endl;
    cout << "Guess a number between 1 and " << maxRange << ": ";

    while (true)

        {
            cin >> guess;

            if (guess == randomNumber)
            {
                cout << "Congratulations! You have guessed the correct
number." << endl;
                cout << "-----" << endl;

                break;
            }
            else if (guess < randomNumber)
            {
                cout << "Oops!!! You entered a too low digit! Try again: ";
            }

            else

            {

                cout << "Oops!!! You entered a too high digit! Try again: ";

            }
        }
}

```

```

    }
}
};

int main()
{
    guessingGame g1;

    g1.difficultylevel();
    g1.generateRandomNumber();
    g1.playGame();

    return 0;
}

```

```

X:\2nd Year\Assignments\c++
-----
Select difficulty level:
-----
1. Easy Level (1-8)
2. Medium Level (1-30)
3. Hard Level (1-50)
-----
Enter which level you want to play (1-3):
-----
1
-----
-----
Guess a number between 1 and 8: 1
Oops!!! You entered a too low digit! Try again: 2
Oops!!! You entered a too low digit! Try again: 3
Oops!!! You entered a too low digit! Try again: 4
Oops!!! You entered a too low digit! Try again: 5
Oops!!! You entered a too low digit! Try again: 6
Oops!!! You entered a too low digit! Try again: 7
Oops!!! You entered a too low digit! Try again: 8
Congratulations! You have guessed the correct number.
-----

Process returned 0 (0x0)   execution time : 17.547 s
Press any key to continue.

```

Task 1 : Programming Exercises:[Data types and Conditional Statements]

3. Write a program that reads an array of integer numbers from the user and sorts the numbers in the ascending order.

```
#include <iostream>

#include <algorithm>

using namespace std;

class ArraySorted
{
private:

    int arr[100];

    int size;

public:
    void getdata()

    {
```

```

    cout << "-----" << endl;

    cout << "Please enter the number of elements in the array: "<<endl;

    cout << "-----" << endl;

    cin >> size;

    if (size <= 0 || size > 100)
    {
        cout << "Invalid size of array. Please enter a number between 1
and 100.\n";
        return;
    }

    cout << "Enter " << size << " integers: ";

    for (int i = 0; i < size; i++)
    {
        cin >> arr[i];
    }

    cout << "-----" << endl;
}

void displayArray()
{
    for (int i = 0; i < size; i++)
    {
        cout << arr[i] << " ";
    }

    cout << endl;
}

```

```

void sortedArray()
{
    cout << "-----" << endl;

    cout << "Original array: ";
    displayArray();

    sort(arr, arr + size);

    cout << "Sorted array in ascending order: ";
    displayArray();

    cout << "-----" << endl;
}
};

int main()
{
    ArraySorted A1;

    A1.getdata();
    A1.sortedArray();

    return 0;
}

```

"X:\2nd Year\Assignments\c+ X

Please enter the number of elements in the array:

5

Enter 5 integers: 11

234

542

133

22

Original array: 11 234 542 133 22

Sorted array in ascending order: 11 22 133 234 542

Process returned 0 (0x0) execution time : 20.515 s

Press any key to continue.
|

```
"X:\2nd Year\Assignments\c+  ×  +  v

-----
Please enter the number of elements in the array:
-----
7
Enter 7 integers: 23
123
6566
212
1123
432
443
-----

Original array: 23 123 6566 212 1123 432 443
Sorted array in ascending order: 23 123 212 432 443 1123 6566
-----

Process returned 0 (0x0)   execution time : 24.562 s
Press any key to continue.
|
```

Task 1 : Programming Exercises:[Data types and Conditional Statements]

4. Write a program that reads a number from the user and based on the user input, it says what day of the week it is, Sundays being 1 and Saturdays being 7. Your system should give appropriate response for invalid input entries.

```
#include <iostream>

using namespace std;

class Weekdays
{
public:
    void displayDay(int day)
    {
        switch (day)
```

```
{
    case 1:

        cout << "Sunday" << endl;
        break;

    case 2:

        cout << "Monday" << endl;
        break;

    case 3:

        cout << "Tuesday" << endl;
        break;

    case 4:

        cout << "Wednesday" << endl;
        break;

    case 5:
        cout << "Thursday" << endl;
        break;

    case 6:

        cout << "Friday" << endl;
        break;

    case 7:

        cout << "Saturday" << endl;
        break;

    default: cout << "WrOnG InPuT! Please enter a number between 1 and
7." << endl;
    }
}

void getDay()
{
    int day;
```

```

        cout << "Enter a number (1-7) For the day of the week: ";

        cin >> day;
        cout<<endl;

        displayDay(day);
    }
};

int main()
{
    Weekdays w1;

    w1.getDay();

    return 0;
}

```

The screenshot shows a terminal window with a tab titled "X:\2nd Year\Assignments\c+". The program's output is displayed, showing a prompt for a day of the week, the input '3', and the resulting output 'Tuesday'. The terminal also shows the process returning 0 and the execution time.

```

-----
Enter a number (1-7) for the day of the week: 3
-----
Tuesday
-----

Process returned 0 (0x0)    execution time : 1.872 s
Press any key to continue.

```

```
C:\X:\2nd Year\Assignments\c+ × + v
-----
Enter a number (1-7) for the day of the week: 6
-----
Friday
-----

Process returned 0 (0x0)    execution time : 4.369 s
Press any key to continue.
|
```
